

Phnom Penh, 30 September 2026

To: The Director, National Blood Transfusion Center

Subject: Request for guidance and confirmation of facts for LifeLink KH, a mobile app that connects voluntary blood donors with patients who need blood

My name is **Nem Sothea**. I am a Senior Software Engineer and an IT Master's student at Asia Euro University (AEU). I write on behalf of a team of five students who built the mobile app **LifeLink KH** in the course Cross-Platform Mobile App Development, supervised by Mr. SOK Pongsametrey. I am also a voluntary blood donor.

LifeLink KH is free, shows no ads and never sells its users' information. It helps:

- **Families** post a need for blood. Our admin checks each request before the app alerts donors whose blood type is compatible and who are near the hospital.
- **Donors** know when they may donate again and what to prepare before going to a centre.
- **Families** understand that relatives of any blood type can donate as replacement, that blood is free by national policy, and never to pay a broker.

The app sends donors only to the NBTC or a hospital blood bank, and always says that the centre's staff make the final decision.

We built LifeLink as volunteers, not for profit. We want to help patients and their families when they need blood urgently, and to help Cambodia's donor community grow together — and one day to share what we learn with people in other countries too. We are not asking for funding or sponsorship, only for guidance, so that what the app tells donors is correct and safe.

What we can offer (free of charge):

- Correct the facts and guide text in the app as soon as the NBTC advises.
- Remind donors when they become eligible again, so they come back to the centre regularly.
- Add the NBTC's blood-drive dates to the donor guide in the app.
- Keep maintaining the app, and give technical advice if the NBTC ever wants it.

How we protect users' information:

- A donor's exact location is never shown to other users. A family's phone number is shown only to a donor who has accepted that family's request.
- Donors can correct their profile at any time, and can delete their account and personal data from within the app.
- All connections are encrypted. We reviewed the app and web portal ourselves against the international OWASP Application Security Verification Standard (ASVS 5.0, Level 1). This is a self-assessment, not a certification; we can share the report if you wish.

The medical facts in the app come from the WHO and from statements by the NBTC reported in the press, but they have not been confirmed by the NBTC itself. I would therefore respectfully ask:

1. To confirm a few facts:

- The minimum time between whole-blood donations for men and for women (we use 3 and 4 months, as 90 and 120 days). Should it be counted in days or in months?
- The age range and minimum weight (we use 18 to 60 years and 45 kg), and the haemoglobin threshold.
- Opening hours for donors, and what a donor must bring (ID card?).

2. To review the guide text for donors and families in the app, and tell us what to correct.

3. If possible, a contact person or the dates of blood drives, so we can tell donors about them.

We will not use the NBTC's name or logo, or say "confirmed by the NBTC", in the app without your permission.

More detail is at <https://lifelinkkh.vercel.app/en/getting-blood>, and screenshots are attached. I can be reached at **010 552 563** or **nemsothea13@gmail.com**.

Thank you for your time and consideration.

Respectfully,

Nem Sothea

On behalf of the LifeLink KH team
